

Limerick Township PWD

Snow Plow Routes

The primary goal of snow and ice control operations is to ensure efficient and safe access for emergency response vehicles.

Within each of the 4 geographic sectors roads are identified and divided into "Demand Service Levels" (DSLs). The DSLs are as follows:

- Collector
- Gravel and Low volume
- Major State and Arterial
- Residential Developments

Although gravel and cul-de-sac roads are classified lower, these roads are serviced with de-icing material or a plow pass within 2 to 3 hours following the dispatch of PWD trucks.

Snow emergencies require prudent planning and constant communication between the snow fighting truck units throughout the Township. Through this communication our trucks and the police are constantly monitoring road conditions.

The department suggests that residents not call the Township for plowing schedules or non-emergency calls as this ties up phone lines, which may be needed for an emergency.

Non-emergency calls also take vital personnel away from snow fighting tasks.
